

Week 1 Summary Report

David Alake

Datasets: Online Retail (E-commerce) & Netflix Movies and TV Shows

Cleaning Challenges

- About 25% of the e-commerce data had no Customer ID, so I dropped those rows since they couldn't be tied to a customer.
- Removed over 8,800 rows with zero or negative quantity, and a few with zero or negative price. These weren't real sales.
- Found and removed over 5,000 duplicate rows in the e-commerce data.
- In the Netflix data, a lot of rows were missing director, cast, or country info, I filled these with "Not Specified" instead of deleting them, since the rest of the row was still useful.
- Spotted 3 Netflix rows where a duration value had accidentally landed in the rating column, I also fixed by moving it to the right place.

What I Found (E-commerce)

- Sales pick up strongly from August and peak in November; clearly tied to holiday shopping season.
- The UK makes up almost all the revenue (£7.2M+), way more than every other country combined.
- The products that sell the most units aren't necessarily the ones making the most money, they're mostly cheap items.
- A handful of customers spend a lot more than everyone else. One customer averaged over £84,000 per order across just 2 orders, likely a bulk buyer.

What I Found (Netflix)

- About 70% of the catalog is movies, only 30% TV shows.
- Netflix added way more content between 2016 and 2019 than any other period, their big growth years.
- The US has the most titles by far, but India is a strong second — shows Netflix investing in international content.
- Most content is rated for mature or teen audiences (TV-MA, TV-14), with very little made for young kids.

Top Takeaways

- The e-commerce business is seasonal and very UK-dependent; worth planning ahead for the Q4 rush and thinking about how to diversify markets.
- A few big-spending customers carry a lot of weight, losing one could hurt revenue significantly.
- Netflix's library reflects its growth strategy: lots of movies early on, then a big push into international markets like India.
- Both datasets needed real attention before analysis: missing values, duplicates, and a few hidden data entry errors all had to be sorted out first.
